

Critical Electric Infrastructure and Supply Chain Constraints

- The reliability of the electric grid and the nation's economy are threatened by critically short supplies of distribution transformers and other critical electric infrastructure materials.
- The American Public Power Association (APPA) urges the Department of Energy (DOE) to utilize Defense Production Act (DPA) authorities to increase the production of distribution transformers. Congress should appropriate \$1 billion toward this effort.
- APPA urges the federal government to work directly with manufacturers to identify short- and long-term solutions addressing the root causes of the distribution transformer shortage, as well as to encourage domestic production.

Background

Distribution transformers are essential for electric utilities to expand capacity, provide electricity to new communities, and restore service when existing infrastructure is damaged during a natural disaster. Recent APPA surveys indicate that 80 percent of public power utilities have lower inventories of distribution transformers now than they did in 2018 and 30 percent reported a high risk they could run out of stock in a month. Lead times to purchase new distribution transformers have grown 429 percent, from three months in 2018 to an excess of 12 months or more today. Manufacturers indicate that a lack of skilled labor and materials are the cause of supply shortages.

Shortages of distribution transformers have caused public power utilities to defer or cancel one in five infrastructure projects that would require more resources than available. As the economy rebounds from the impacts of the pandemic, additional electric capacity is needed to power new residential and commercial development, new manufacturing facilities, and to support a rapidly expanding electric vehicle fleet. Public power utilities are investing heavily in clean energy technologies to meet environmental goals. Simultaneously, the industry is facing more frequent and severe extreme weather events, requiring more resource-intensive response and restoration.

To ensure that supply chain constraints do not impact reliability, utilities are taking extraordinary measures to meet current demand with limited supply. That includes refurbishing older equipment and identifying swapping equipment in the field to generate spares from underutilized equipment. These are necessary, last-ditch efforts to protect the safety of electric customers and sustain other sectors that depend on electricity, but they move the industry further away from clean energy, efficiency, and affordability goals.

Even with a strong mutual aid program in place, for the first time, public power utilities are raising concerns that they may not have the stocks to assist.

Administrative and Industry Action

On June 6, 2022, President Biden authorized the use of the DPA to accelerate the domestic production of clean energy technologies. Specifically, the President authorized DOE to use the DPA to “rapidly expand American manufacturing of five critical clean energy technologies: photovoltaic modules and module components for solar panels; building insulation; heat pumps; equipment for making

and using clean electricity generated fuels, including electrolyzers, fuel cells, and related platinum group metals; and critical power grid infrastructure, such as transformers.” President Biden also authorized a “24-month bridge” temporarily freezing tariffs on solar panel imports from southeast Asian countries to meet U.S. electricity generation needs while domestic manufacturing ramps up. In September 2022, DOE issued a Request for Information seeking stakeholders’ input on how it should use its authority under Title III of the DPA to address supply chain issues. APPA filed comments urging a focus on providing support to increase labor and material acquisition.

In a November letter to congressional appropriations committee leaders, APPA, the National Rural Electric Cooperative Association (NRECA), Edison Electric Institute, National Association of Homebuilders, Associated General Contractors, and Leading Builders of America requested \$1 billion toward DPA authorities to help address the distribution transformer supply chain crisis. Unfortunately, the year-end appropriations bill did not include this funding.

APPA is pursuing every avenue to help increase the supply of distribution transformers. In May 2022, APPA and NRECA asked DOE Secretary Jennifer Granholm to temporarily waive the energy conservation standard for distribution transformers. APPA and NRECA believe that this could help manufacturers increase production. Unfortunately, DOE denied this request. In October 2022, APPA and NRECA also urged DOE to prioritize funding it received in the Inflation Reduction Act for DPA-related activities, to be directed specifically toward distribution transformers. DOE has not yet formally responded.

APPA is also participating in a Supply Chain Tiger Team established by the Electric Subsector Coordinating Council to address resiliency and security concerns arising from supply chain constraints. This team has identified labor and material availability as the greatest needs for manufacturers to immediately increase production.

APPA has set up a web service to facilitate a voluntary transformer exchange where APPA members are able to contact other members to address urgent equipment needs. Finally, APPA will be hosting a Supply Chain Summit in March 2023 to discuss issues unique to public power.

The American Public Power Association is the voice of not-for-profit, community-owned utilities that power 2,000 towns and cities nationwide. We represent public power before the federal government and protect the interests of the more than 49 million people that public power utilities serve and the 96,000 people they employ.
